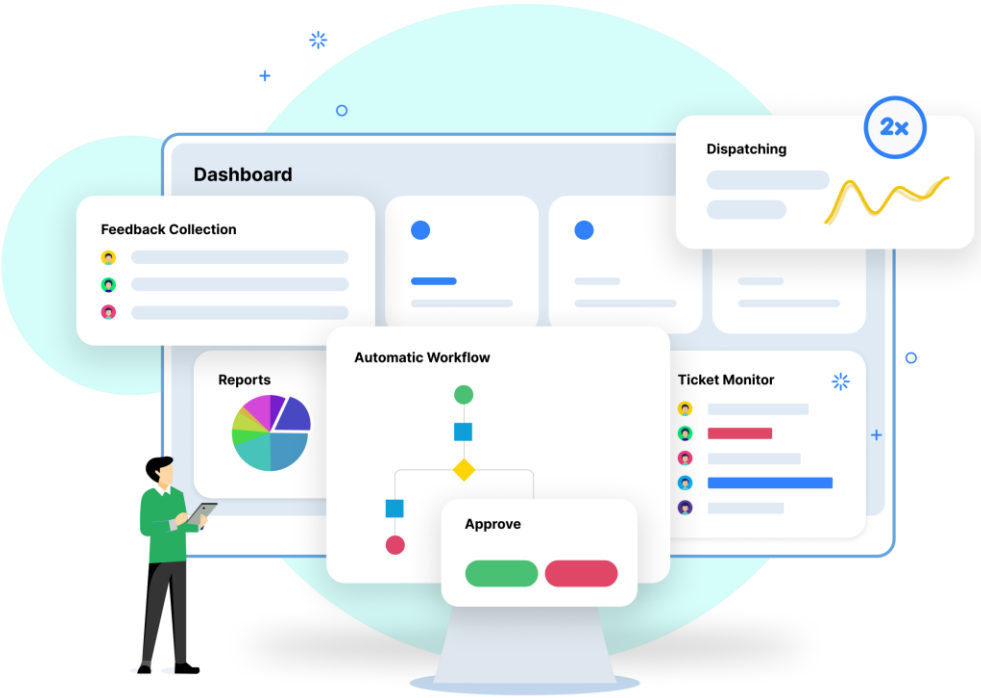
PROJECT PROPOSAL

Enhancing Legacy Restaurant POS System – For POS360



Dated on

10 Jun 2025

Prepared for

POS360, South Africa

Prepared by
5th Floor, Technopark Trivandrum, CDAC Building, Main Campus, Technopark Campus, Thiruvananthapuram, Kerala 695581

This document contains confidential and proprietary information belonging to UpBuff Technologies. It is provided exclusively to POS360 for evaluation and consideration. Unauthorized copying, distribution, or disclosure of its contents to any third party is strictly prohibited without prior written consent from Upbuff Technologies.

Enhancing Legacy Restaurant POS System – POS360

Dear Sir,

We are pleased to submit our proposal for the design, development, and deployment of a cloud-based enhancement application tailored for the POS360 restaurant software solution. This project addresses the specific challenges of integrating with a legacy POS system that lacks direct API access and operates with dynamic IP addresses, delivering key functionalities to optimize operations, improve data capture, and facilitate timely reporting.

Our proposed solution leverages a secure and scalable architecture to provide two core functionalities: (1) a mobile and cloud-based platform for real-time invoice scanning, intelligent data extraction & CSV download, and seamless integration with the existing POS database; and (2) automated daily sales data SMS notifications for restaurant owners. This approach incorporates AI-powered OCR scanning, robust security and user access control measures, and lightweight agent-based technology to bridge the gap between the legacy system and modern cloud services.

This proposal includes a detailed outline of our technical approach and solution architecture, project plan and implementation timeline, pricing model, commercial terms, support & maintenance structure, and compliance with security and regulatory requirements. For further clarification, please contact us at support@upbuff.com.

We anticipate your positive response and the opportunity to collaborate in enhancing the efficiency and data accessibility of your POS360 operations.

Sincerely,

Shiburaj
Founder & Director

1. Executive Summary

1.1 Introduction

This proposal outlines a solution to enhance the capabilities of the existing POS360 application, with a focus on improving operational efficiency and stakeholder communication in restaurant environments. While the current POS system effectively manages core transactional and inventory functions, the lack of direct API access and the presence of dynamic IP addresses present challenges for modernizing data workflows and reporting. This proposal addresses these challenges by introducing a non-invasive integration strategy.

The proposed enhancement introduces two key functionalities: a mobile-based invoice scanning feature, enabling staff to quickly capture and process supplier invoices, and an automated daily sales summary via SMS, ensuring timely updates are delivered directly to restaurant owners. These additions are designed to complement the existing POS360 system, streamline daily tasks, and enhance visibility into restaurant performance without requiring modifications to its core functionality or database schema. A lightweight agent will be installed on the restaurant's local network to facilitate secure communication with the cloud-based services, overcoming the limitations of dynamic IP addresses.

By building on the foundation of the POS360 platform, this solution aims to bring greater convenience, faster data entry, and improved transparency—empowering teams to focus more on service and less on manual data entry and reconciliation. The solution will leverage cloud-based services for scalability and maintainability.

1.2 Business Objectives

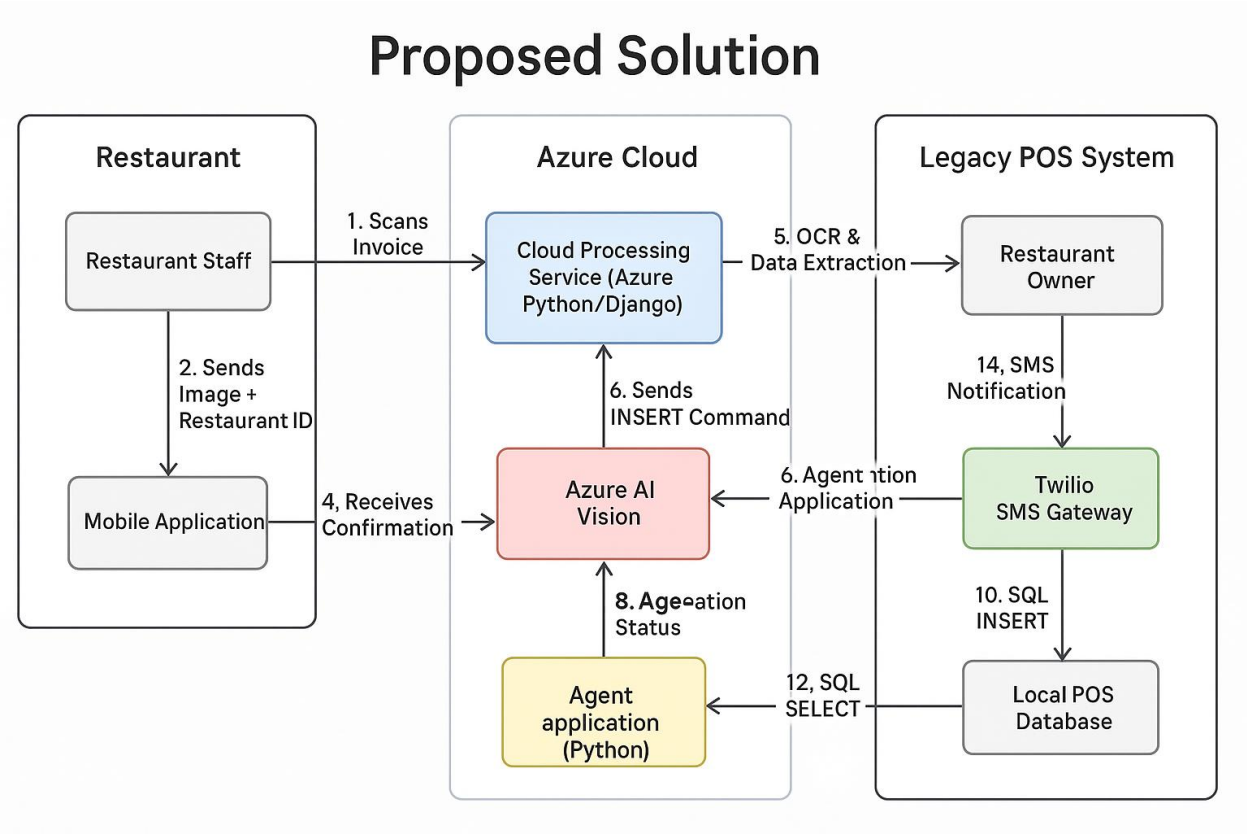
The objective of this proposal is to enhance the existing restaurant POS system by integrating intelligent features that streamline invoice management, improve data accessibility, and ensure timely communication with client stakeholders. These enhancements are designed to reduce manual work, improve operational visibility, and support data-driven decision-making. The key components of the proposed solution include:

1. **Mobile app-based invoice capture:** Allow restaurant staff to capture physical invoices using mobile devices, enabling quick and accurate data input at the source and reducing manual entry efforts.
2. **AI-driven invoice processing through a web-based solution:** Automatically extract, validate, and organize key invoice data using artificial intelligence. The web interface ensures smooth integration with existing systems for real-time updates on expenses and inventory.
3. **Downloadable scanned invoice data in CSV format:** Provide options to export processed invoice data as CSV files for reporting, compliance, or offline analysis.
4. **Automated SMS notifications for daily sales data to client stakeholders:** Send daily sales summaries directly to client stakeholders via SMS, ensuring timely performance updates without requiring manual checks.

5. **SMS gateway integration:** Integrate with a secure SMS gateway service to enable automated, scalable delivery of sales alerts and notifications to client stakeholders.
6. **User login access management:** Implement role-based login access to manage user permissions and data visibility. This ensures that different user groups (e.g., staff, managers, admins) have appropriate access levels based on their roles and responsibilities.

2. Proposed Solution

We propose a smart application that automates tasks, manages user access, integrates with an SMS gateway, and uses AI to process invoice data. The solution includes development, testing, training, and support for smooth, efficient operations.



2.1. Invoice Scanning Solution

This solution comprises a mobile scanning application and a cloud-based processing service.

2.1.1 Mobile Scanning Solution (For Restaurant Staff)

The mobility solution is designed to simplify and accelerate invoice handling through a dedicated mobile application for both iOS and Android platforms. Restaurant staff can use their smartphones to capture physical invoices on-site, enabling quick, accurate data collection and reducing reliance on manual entry. Captured data is instantly synced with the web-based platform for real-time processing and analysis.

Key features include:

- **Scanning Functionality:**
  - Utilize device camera for capturing invoice images.
  - Implement image processing techniques (e.g., perspective correction, noise reduction) for clear image capture.
  - Offer manual cropping and adjustment options.
- **Optical Character Recognition (OCR):**
  - Integrate a robust OCR library (cloud-based) to extract text from the scanned invoice.
  - Support multiple languages.
- **Data Extraction and Mapping:**
  - Employ intelligent algorithms to identify key fields on the invoice (supplier name, invoice number, date, line items, quantities, unit prices, totals, VAT/tax).
  - Allow manual review and editing of extracted data before submission.
  - Map the extracted data to the relevant fields in the legacy POS database structure.
- **Secure Data Transmission:**
  - Encrypt data during transmission to the cloud service using HTTPS.
  - Authenticate the mobile application with the cloud service.
- **Restaurant Identification:**
  - The mobile app will require the restaurant's unique identification number (obtained during the legacy POS installation) for associating the scanned invoice with the correct restaurant. This could be entered manually or stored within the app after initial login.

2.1.2 Cloud Based Processing Service

A scalable cloud platform, primarily Microsoft Azure. Google Cloud Platform will be considered as a secondary option should performance issues arise on Azure.

Key features include:

- **Data Reception and Validation:**
  - Securely receive scanned invoice data from the mobile applications.
  - Validate the received data format and completeness.
  - Authenticate the incoming request based on the restaurant's unique ID.

- **Intelligent Data Processing:**
  - Further refine the OCR output and data extraction using more advanced algorithms and potentially machine learning models trained on invoice formats.
  - Implement logic to match the extracted supplier name with existing suppliers in the legacy POS database (fuzzy matching algorithms).
- **Local Database Interaction:**
  - **Challenge:** Directly accessing each restaurant's local SQL database without static IPs or domains is complex.

- **Proposed Solution:** Agent-Based Approach: Install a lightweight "Agent" application on each restaurant's POS system. This agent will reside on the same network as the local SQL database.
- **Agent Functionality:**
  - Establish a secure, outbound connection to the cloud processing service (this overcomes the dynamic IP and firewall issues).
  - Listen for instructions from the cloud service to perform database operations.
  - Execute SQL INSERT statements (generated by the cloud service based on the extracted invoice data) on the local SQL database.
  - Securely transmit the status of the database operation back to the cloud service.
- **Communication Protocol:** Use a secure and persistent communication protocol like WebSockets for real-time or near real-time communication between the cloud service and the agents.

- **Error Handling and Logging:**
  - Implement robust error handling mechanisms to manage issues during data extraction, processing, and database interaction.
  - Maintain detailed logs for monitoring and troubleshooting.
- **Reporting and Monitoring:**
  - Provide a web-based admin panel for your partner to monitor the status of invoice processing across all restaurants. The admin panel will be developed using Python (Django) and MySQL.
  - The web app window will also facilitate manual verification of the captured invoice data with the actual invoice and submit, history of transactions etc.

2.2. Automated SMS Notification

This solution will also leverage the agent-based architecture for data retrieval from the local POS systems.

2.2.1 Cloud-Based Notification Service

The same scalable cloud platform is used for invoice processing (Primarily Microsoft Azure, with Google Cloud Platform as a contingency).

Key aspects include:

- **Configuration:**
  - Allow restaurant owners (through a web portal or potentially the mobile app) to configure the types of notifications they want to receive (e.g., daily sales summary, total purchases, hourly sales).
  - Enable them to specify the phone number(s) for receiving notifications.
  - Allow setting schedules for notifications (e.g., daily at 6 PM).
- **Data Aggregation and Formatting:**
  - The cloud service will orchestrate the retrieval of relevant data from each restaurant's local database via the installed agents.
  - Aggregate and format the data into concise SMS messages.

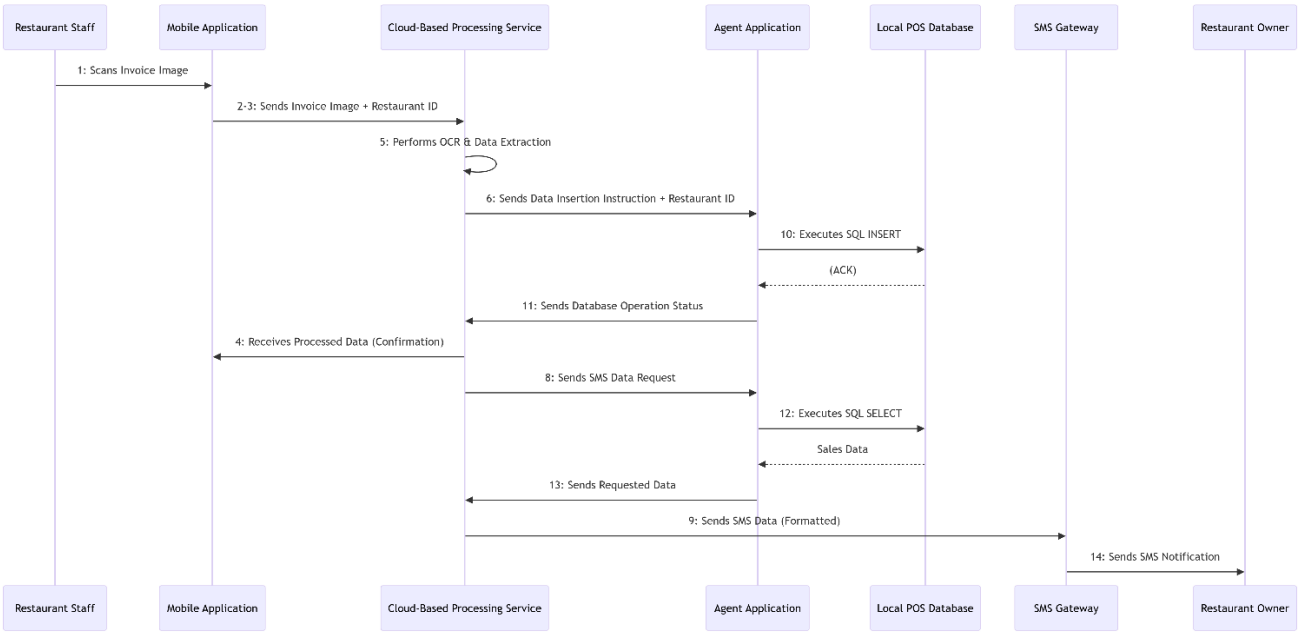
- **SMS Gateway Integration:**
  - Integrate with a reliable SMS gateway provider (e.g., Twilio).
- **Scheduling and Triggering:**
  - Implement a scheduling mechanism (e.g., cron jobs, cloud scheduler) to trigger data retrieval and SMS sending at the specified times.
- Consider event-based triggers for certain notifications (e.g., low stock alerts - if feasible to implement through database monitoring by the agent).

2.2.2 Agent Enhancement (For Notification)

The existing agent application will be enhanced with the following capabilities:

- Listen for requests from the cloud notification service to retrieve specific data from the local SQL database (e.g., total sales for the day, total purchase amount).
- Execute SQL SELECT queries on the local database.
- Securely transmit the retrieved data back to the cloud notification service.

2.3. Communication Flow



Key Interactions:

1. Invoice Scanning Workflow:

- Staff scans an invoice via the mobile app (Step 1).
- The app sends the image and restaurant ID to the cloud service (Steps 2–3).

- The cloud service processes the image using OCR (Step 5), option to download CSV, then instructs the agent to insert data into the local POS database (Step 6).
- The agent executes the SQL INSERT and reports the status back (Steps 10–11).
- The mobile app receives confirmation (Step 4).

2. SMS Notification Workflow:

- The cloud service triggers a data request (Step 8) for SMS notifications (e.g., scheduled daily).
- The agent queries the local database (Step 12) and returns sales data (Step 13).
- The cloud service formats the data and sends it via the SMS gateway (Steps 9–14).

3. Components:

- Mobile Application: Handles invoice scanning and user interaction.
- Cloud Service: Central hub for OCR, data processing, and orchestration.
- Agent Application: Acts as a bridge between the cloud and legacy POS database.
- Local POS Database: Stores transactional data (legacy system).
- SMS Gateway: Delivers notifications to restaurant owners.

3. Security and Access Control

To protect sensitive data and ensure system integrity, robust security measures will be implemented throughout the system, including:

- Secure Communication: All data transmitted between the mobile application, cloud services, and the agent will be encrypted using SSL/TLS.
- Role-Based Access Control (RBAC): Access to the administrative web portal and system functionalities will be controlled based on user roles.
- Data Encryption at Rest: Sensitive data in the cloud database will be encrypted using industry-standard algorithms.
- Agent Security: The agent application will be designed with security best practices, including secure authentication, restricted database access, and regular updates.
- Audit Logs & Monitoring: All user activities, system events, and data access will be logged, monitored, and regularly reviewed.

4. Testing and Quality Assurance

Comprehensive testing and quality assurance procedures will be conducted to ensure a reliable and high-performance system. This will include:

- **Functional & Performance Testing:** Validate system capabilities under various scenarios.
- **Integration Testing:** Ensure seamless communication between different modules and external systems.
- **Security & Compliance Testing:** Identify vulnerabilities and enforce data protection standards.
- **User Acceptance Testing (UAT):** Gather feedback from stakeholders to refine the system before deployment.

5. Training and User Adoption

To facilitate a smooth transition and maximize user efficiency, a structured training and adoption strategy will be implemented:

- **Role-Specific Training Sessions:** Tailored programs for different user groups, including administrators, field teams, and managers.
- **Onboarding Documentation & Tutorials:** Step-by-step guides and video tutorials for easy reference.
- **Ongoing Support & Helpdesk Assistance:** Continuous support to address queries and ensure successful adoption.

6. Project Timeline

Project Execution Plan: 3-4 Months

A typical implementation for a POS enhancement system like the one described could take anywhere from 3 to 4 months. Here's a breakdown of the factors that influence this timeline and the typical duration of each phase:

Factors Influencing Implementation Time:

- **Complexity of Legacy System Integration:** The primary challenge is integrating with a legacy POS system without direct API access. The more complex the database schema and the agent deployment process, the longer it will take.
- **Number of Restaurants:** Implementing the system across 100 restaurants adds to the logistical complexity. The agent deployment, configuration, and initial setup at each location can be time-consuming.
- **Customization Requirements:** If the client has specific customization needs beyond the core functionalities (invoice scanning, data extraction, CSV download, and SMS notifications), this will add development and testing time.

- **Client's IT Infrastructure and Availability:** The client's IT infrastructure, their staff's availability for training and support, and the responsiveness of their team can all affect the timeline.
- **Testing and Quality Assurance:** Thorough testing is crucial to ensure the system's stability, security, and accuracy. The more extensive the testing, the longer this phase will take.
- **Training and Documentation:** Providing comprehensive training and documentation for all users (restaurant staff, owners, and administrative personnel) requires time and resources.

Typical Implementation Phases and Estimated Durations:

1. Planning and Requirements Gathering (1-2 week):
   - Detailed analysis of the legacy POS system's database schema (Completed).
   - Finalizing system requirements and specifications with the client.
   - Planning the agent deployment strategy.
   - Setting up the cloud infrastructure.

2. Development and Configuration (4-8 weeks):
   - Developing the mobile application (Flutter).
   - Developing the cloud-based processing service (Python/Django).
   - Developing the agent application (Python).
   - Configuring the database (MySQL).
   - Integrating with the OCR service (Azure AI Vision) and SMS gateway (Twilio).
   - Implementing security measures (SSL, RBAC, data encryption).

3. Testing and Quality Assurance (2-4 weeks):
   - Unit testing of individual components.
   - Integration testing of the entire system.
   - User acceptance testing (UAT) with a pilot group of restaurants.
   - Performance testing and load testing.
   - Security testing.

4. Deployment and Training (2-4 weeks):
   - Deploying the agent application to all 100 restaurants.
   - Configuring the system for each restaurant.
   - Providing training to restaurant staff, owners, and administrative personnel.
   - Deploying the mobile application to restaurant staff devices.

5. Post-Implementation Support and Monitoring (Ongoing):
   - Providing ongoing technical support.
   - Monitoring system performance and stability.
   - Addressing any issues or bugs.
   - Providing system updates and enhancements.

7. Project Management and Communication

To ensure efficient execution and seamless collaboration, a structured project management and communication framework will be implemented, leveraging FieldNXT too for real-time project visibility. Key activities include:

- **Real-time Project Tracking with FieldNXT:** Throughout the project lifecycle, we will utilize FieldNXT, our dedicated project management platform. This will provide the client with continuous, up-to-date access to project status, progress on individual modules, and time spent on each activity.
- **Regular Progress Updates:** In addition to FieldNXT's real-time tracking, scheduled status reports will be provided to keep stakeholders informed of key milestones, potential risks, and dependencies.
- **Status Meetings & Reviews:** Weekly or bi-weekly meetings will be held to discuss progress, address challenges, and align on priorities. These meetings will be complemented by the real-time data available in FieldNXT.

- **Issue Tracking & Resolution:** A centralized system within FieldNXT will be used for logging, monitoring, and resolving issues in a timely manner. This ensures that all stakeholders have visibility into the status of any reported issues.

8. Acceptance Criteria

The final product will be considered acceptable upon meeting the following criteria:

- All specified features and functionalities of the POS enhancement system are successfully developed, tested, and validated.
- The mobile scanning application and the cloud-based processing service are fully integrated, ensuring seamless data synchronization.
- User authentication, role-based access control, and security protocols (including SSL/TLS) function as expected.
- Invoice data capture automation enhances operational efficiency and reduces manual intervention.
- The agent application is successfully deployed and communicates with the cloud service as expected.
- Automated SMS notifications are delivered to restaurant owners as configured.
- The application performs optimally under expected load conditions, meeting scalability and performance benchmarks.
- User Acceptance Testing (UAT) is completed, and all critical feedback is addressed.
- The system generates accurate reports and analytics, supporting data-driven decision-making (accessible via the administrative web portal).
- End-user training, documentation, and knowledge transfer are successfully conducted.
- Final deployment is completed, and the system operates in a stable, secure, and fully functional state.

9. Post-Project Support

Post-implementation support is crucial for ensuring the long-term stability, efficiency, and security of the POS enhancement system. This phase includes technical assistance, system maintenance, security updates, and performance monitoring to address any issues and facilitate continuous improvements.

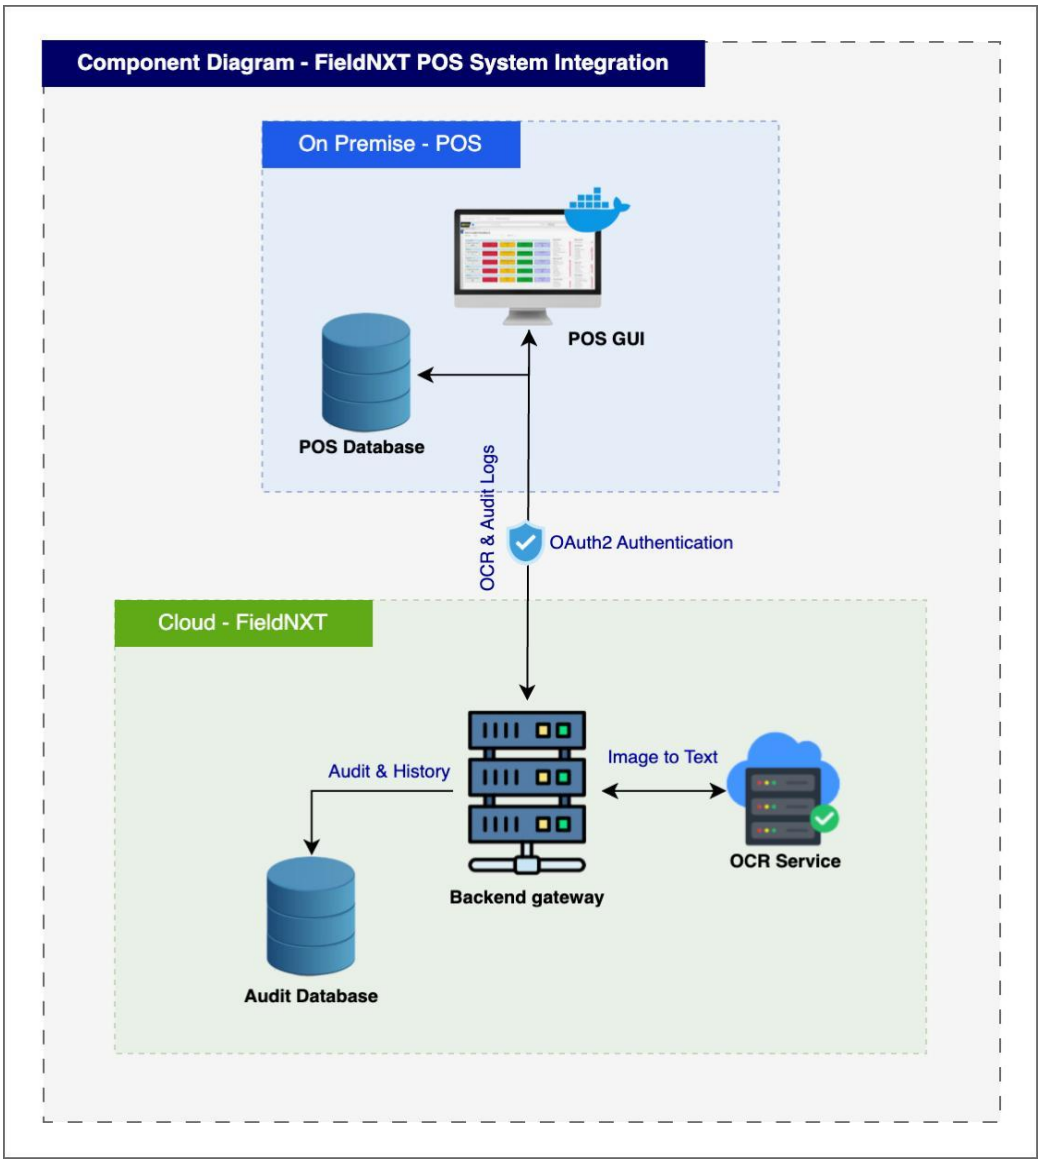
1. **Technical Support:** The support team will provide timely resolution of technical issues to maintain system stability. Remote and on-site assistance will be available for troubleshooting and operational concerns. Regular system health checks will be conducted to identify potential issues early and ensure uninterrupted operations.
2. **Bug Fixes and Enhancements:** Any bugs or defects discovered after deployment will be promptly addressed to maintain system reliability. Continuous improvements and enhancements will be implemented based on user feedback and evolving business requirements to optimize performance and usability.

3. **Performance Monitoring:** The system's performance will be continuously monitored to detect inefficiencies and bottlenecks. Performance tuning and optimization strategies will be applied to ensure smooth operation, improve response times, and enhance overall efficiency.
4. **Data Integrity and Security:** Measures will be taken to safeguard data integrity and security, ensuring the secure exchange of information between the mobile application, cloud services, and the agent application. Regular security updates and compliance protocols, including addressing vulnerabilities related to SSL/TLS, will be implemented to protect sensitive data from potential threats.
5. **User Training and Documentation**: Ongoing training sessions will be provided to help users effectively utilize the system, including the mobile scanning application, the administrative web portal, and reporting functionalities. User manuals and training materials will be regularly updated to reflect any new features, optimizations, or changes in workflows.
6. **Change Management:** A structured change management process will be implemented to handle system updates with minimal operational disruption. All modifications, including updates to the agent application and cloud services, will be tracked and documented to ensure transparency and facilitate a smooth transition when changes are introduced.
7. **System Upgrades and Maintenance:** Periodic system upgrades will be planned and executed to keep the platform aligned with the latest technologies. Preventive maintenance activities will be conducted to enhance system longevity and ensure compatibility with evolving business needs, including updates to maintain compatibility with the POS360 system.
8. **Reporting and Analytics:** Comprehensive reports will be generated to provide insights into system performance, resource utilization, and efficiency of POS enhancement, including data related to invoice processing and SMS notification delivery. Advanced analytics will be used to track key trends and identify areas for improvement, ensuring data-driven decision-making.
9. **Communication and Escalation:** Clear communication channels will be maintained to keep stakeholders informed about system updates, performance, and support activities. A structured escalation process will be in place to address critical issues efficiently and minimize downtime.
10. **Service Level Agreement (SLA):** A well-defined SLA will outline response times, resolution commitments, and service expectations. Regular evaluations will be conducted to ensure adherence to the SLA, with continuous improvements in support processes to enhance service quality.
11. **Knowledge Transfer**: Knowledge transfer sessions will be conducted to equip client's internal teams or designated support providers with the necessary expertise to manage and maintain the system. Documentation of key processes and best practices will ensure a seamless transition and continuity in support.
12. **Continuous Improvement:** User feedback will be actively gathered to identify opportunities for system enhancements. Lessons learned from ongoing operations will be incorporated into iterative improvements, ensuring the system remains efficient, user-friendly, and adaptable to changing needs.

13. **Handover and Transition:** A structured handover process will be facilitated to transition system management to the client's internal IT team or an external support provider. All necessary documentation, training, and support materials will be provided to ensure a smooth transition.
14. **Emergency Response Plan:** A proactive emergency response plan will be developed to handle critical situations such as system outages or security breaches. Quick incident resolution strategies will be implemented to minimize disruptions and maintain business continuity.
15. **Support Availability:** Clearly defined support hours and accessible communication channels will be established to provide timely assistance. Various support tiers, including emergency response options, will be available to address urgent issues efficiently.

10. Technology Stack and Solution Architecture

High Level Component Diagram for the Proposed Solution



The following technology stack will be employed for the development of this solution:

- **Cloud Platform:** Microsoft Azure (with Google Cloud Platform as a contingency)
- **Mobile Development:** Flutter (iOS and Android)
- **Backend Development (Cloud):** Python (Django)
- **Database (Cloud):** MySQL
- **OCR Library:** Microsoft Azure AI Vision
- **Communication Protocol (Cloud-Agent):** WebSocket
- **SMS Gateway:** Twilio
- **Agent Development:** Python

11. Hardware Specifications for Web Server

The following entry level hardware specifications are required for installing the Web Server on a physical or a virtual machine

Hardware Configuration		
	Minimum	**Recommended**
CPU	**4 Cores**	**8 Cores**
RAM	**8 GB**	**32 GB**
SSD	**250 GB**	**500 GB**

Scalability: Horizontal Scaling: The system should be designed to scale horizontally by adding more web server instances as needed.
Load Balancing: Implement load balancing to distribute traffic across multiple servers and ensure high availability.
Auto Scaling: Utilize auto-scaling features provided by the cloud provider to automatically adjust the number of servers based on traffic demand.
Additional Considerations:

- Operating System: Linux (e.g., Ubuntu, CentOS)
- Web Server Software: Apache or Nginx
- Application Server: WSGI server (e.g., Gunicorn, uWSGI)

Security:

- Firewall
- SSL/TLS certificates
- Regular security updates

Monitoring:

- System monitoring tools (e.g., Prometheus, Grafana, CloudWatch)
- Application performance monitoring (APM) tools (e.g., New Relic, Datadog)

Backup and Disaster Recovery:

- Regular database backups
- Disaster recovery plan to ensure business continuity

12. Total Project Cost Breakdown

Components	Cost in USD
Monthly cost	$2500.00
Total number of months to complete the solution	4
Total Project Cost ($2500 x 4)	**$10,000.00**

Notes:

- Third-party subscription costs (e.g., SaaS tools & platforms, APIs) are excluded and billed separately by vendors.

13. Proposed Pricing Model

Sl.No.	Details
1	The Developer shall allocate resources amounting to 160 hours per month.
2	The Client agrees to pay the Developer at the rate of USD USD 2500 per month.

Note:

- Invoicing: Invoices will be generated upfront at the beginning of each calendar month.
- Payment Terms: The Client shall process and settle all invoices within eight (8) calendar days from the date of submission.
- Variable Charges (Cloud Infrastructure, OCR Service Calls, SMS Gateway): These charges will be handled in one of the following ways, based on mutual agreement:
  - Billed to the Client by the Developer at actual cost.
  - Paid directly by the Client to the respective service providers.
- Annual Maintenance Contract (AMC): An Annual Maintenance Contract will be planned and finalized separately upon the successful completion and acceptance of the agreed-upon solution.

14. Third-Party Charges

- All cloud infrastructure charges, OCR service call charges, and SMS gateway charges will be:
  - Billed at actuals to the Client by the Developer, OR
  - Paid directly by the Client to the respective service providers, based on mutual agreement.

15. Ownership of Intellectual Property (IP)

- All rights, titles, and interests in the developed solution and its associated intellectual property under the POS360 project shall be owned by the Client.

- The Developer retains no ownership or licensing rights over the final solution delivered under this engagement.

16. Confidentiality

Both parties agree to maintain confidentiality regarding all proprietary information and business data shared during the project. This obligation shall survive the termination or completion of the agreement.

17. Termination

Either party may terminate this Agreement by providing 30 days' prior written notice. Upon termination, the Developer shall be entitled to compensation for all billable hours and approved expenses incurred up to the termination date.

18. Limitation of Liability

In no event shall either party be liable for any indirect, incidental, or consequential damages arising from this Agreement. Liability shall be limited to the total compensation received by the Developer under this Agreement.

19. Governing Law

This Agreement shall be governed by and construed in accordance with the laws of India, and the courts located in Kerala shall have exclusive jurisdiction.

20. Entire Agreement

This Agreement constitutes the entire understanding between the Client and Developer. No amendments or modifications shall be valid unless made in writing and signed by both parties.

21. Agreed and Accepted

This Purchase Proposal, along with any attachments and all documents incorporated by reference herein, constitutes the entire agreement and understanding between UpBuff Technologies Pvt. Ltd. and the entity acquiring the proposed software, support and services. By signing below, the parties accept the terms and conditions as detailed in this Purchase Proposal and in all attachments and other documents referenced herein.

UpBuff Technologies Pvt. Ltd. 5th Floor, Technopark Trivandrum CDAC Building Main Campus Thiruvananthapuram, Kerala 695581 India	**POS360** Unit 10226, Black Eagle Ave, Cedar Lakes Estate, Fourways, Gauteng, South Africa
